The hoof care spray mat consists of three special designed parts, bottom mat, spray mat and cover mat.

While crossing the HoofCare SprayMat hoofs are automatically sprayed with clean liquid. The mat, which required virtually no maintenance, can be left in a permanent position as it is not an obstacle to animals.

The HoofCare SprayMat is ideally positioned at the exit of a parlour or milking robot where animals can cross it a number of times per day.

The hoof care spray mat will be installed on the floor of a walkway just outside the exit of the milking parlour or milking robot. If the cow walks over the mat and steps with one foot on or near a coloured sphere, a valve will open and the liquid is then forced out through the nozzle. The liquid is sprayed forcefully against the foot and the medication or disinfecting agent will be sprayed into the hard-to-reach areas. The liquid pressure and the height of the jet can be adjusting by the control unit. The system is connected to the water mains. A dosing pump in the control unit will add the correct amount of medication to the water.

The dimension of one mat is 80x40 cm, you will need 4 mats to reach a length of 160 cm.

The Vink HoofCare SprayMat hits all the right spots

- Medication is consistently applied to the correct areas
- Reduces labour costs
- Medication does not get contaminated
- Suitable for any operation including robotic
- Provides an effective and economical use of consumables
- Ensures all hoofs are disinfected several times per week.

An ideal solution for contagious hoof diseases for every milking parlour and especially for the milking robot.
